SFTP SERVER TO POSTGRES

Read file(s) from SFTP server;
Bulk insert into Postgres staging table

Created by Cadence Daniels

KEY ATTRIBUTES
- `ListSFTP`: pulls list of files from SFTP server and creates flow file for each file
- `FetchSFTP`: pulls content from files on SFTP servers and populates the flow file
- `PutDatabaseRecord`: inputs records from flow files into Postgres table

CONTROLLER SERVICES CREATED
- `CSVReader`: parses incoming, formatted data
- `AvroSchemaRegistry`: interprets *temperature_table* in database
- `PostgresCon`: connects to Exelon Postgres database

NOTES
- *Carefully check that database configuration details are updated across the **entire** flow when configuring a new database connection*. The `AvroSchemaRegistry` and `PostgresCon` Controller Services hold majority of the Postgres connection details, but many other processors and services require additional information (i.e. database table name).
- This template utilizes Enterprise Connect (EC).
